

Cataclysm: Dark Days Ahead, or C:DDA, is an open source post-apocalyptic turn-based survival RPG that challenges players to not only survive, but battle a wide range of zombies and other terrifying creatures that threaten their lives.

Just like @Terrorforge said, I also thought the "battery charger" was a wall-socket-thingy, a "charging brick" used on cellphones or rechargeable batteries, or something like that (as the name implies). Is this intended to represent a battery charger's CIRCUIT? If that's the case, then maybe the word "circuit" should be added to the end of the item's name, and let be ...

As far as I know you need to have a Storage battery connected to your grid to be able to use appliances. Even if your solar panels generate enough energy to run them. ... Since the main issue has been answered (need a battery), wall wiring: When you reveal it, it turns the wall into a one tile appliance that can pass electricity.

Yeah, a storage battery weighs over 300 pounds, so it's tough for the average character to lift without assistance. You need one of the following: - An NPC friend (preferably average or ...

For a place to charge batteries, you need a storage component, a recharger, a battery, and a power source, like solar or engine+alternator. You also need a dashboard or electronics control unit to turn on the recharger. ... ??? My car making a turn in CDDA... just before the ??? Mi-Go / Monsters enters through the ...

The current storage battery system also already does a good job of just having large storage batteries made up of many smaller storage batteries like is done IRL. Someone correct me if I'm wrong because I'm not a chemist but, I don't think there's much survivor usable chemical difference between the lithium chemistries.

Foot pedals turn your character's STR stat into vehicle power. Truck alternators use a lot of vehicle power to generate charge. Every alternator has a minimum vehicle power it requires in order to generate charge, and if the vehicle lacks enough power to work its alternator(s), the engine won't run at all.

As the other posts said, in order to use a recharging station, you first need to add some kind of storage space (like a trunk or cargo space) to your vehicle. Then install a battery recharger or recharging station on top of the storage space. Once this is done, rechargeable batteries placed into the space will recharge by drawing on vehicle power.

Basically you need a power source, be it a home made generator, solar pannels, a water wheel, ect. Then you need a battery to store power in, a car batter, large storage battery, ect from vehicles, as you can't run directly off of a power source. You connect the power source directly by being within 1 space of the power source and plugging it ...

28 votes, 11 comments. true. You can use them as very space efficient storage for static power grids (at least in experimental) to the point where one of them I probably enough for basically anything you want to do as long as you have a few solar panels (which are much easier to get now if you check the roofs of certain buildings)

To recharge the UPS, you have to unload it and charge the actual heavy-duty battery. My guess is you need to connect a vehicle battery to the recharging station vehicle, so it can drain that battery to recharge the rechargeable portable batteries. Then you can charge the vehicle battery by one of the above methods.

French Polynesian Renewable Energy Incentives. In French Polynesia, the government is actively encouraging the use of renewable energy, including solar panels and battery storage systems, as part of its commitment to reducing reliance on imported fossil fuels and transitioning toward a more sustainable energy mix.

As far as the foot crank method goes, you can add an alternator to a bicycle or wheelchair, and add a battery, this allows you to charge batteries via pedal power. The foot crank has enough power to power a truck alternator. The best thing is, all you need is the frame, the footcrank, the alternator and the battery, a seat, and controls.

when trying to hookup solar panels and storage batteries into the grid should I build a vehicle of place them via the construction menu? I placed solar panels on the ground outside, via the construction menu, and can't seem to hook them into the house. I've tried using extension cords and the option when you examine the panel.

Now that you have something with Hammering 2 (The makeshift hammer) you can craft a screwdriver with the two by fours from downstairs and the leftover parts from the storage locker - whether they are chunks of steel, or scrap metal. You get enough of each when you smash a locker for the pipe.

I want to remove some swappable storage batteries from an electric car but i cant lift it. I have mechanics 4 and some objects i have collected: a bottle jack, a sissors jack, an airjack and a pallet lifter.
