How does an islanding solar inverter work?

Your islanding solar inverter works independently from the power grid. If there's a storm or other event that knocks out the main power grid, your solar power system will continue running and providing power to your home. We mention this because many people mistake going solar with going off-grid, but that's typically not the case.

Can a solar inverter provide energy during a power outage?

Integrating a solar inverter with island mode and battery storage will help make this dream a reality. If you want a solar power system that can still provide energy during a power outage, it's best to work with an experienced company like Palmetto.

How do solar inverters work?

By creating a small "solar energy island" your solar panels can keep operating your home without the risk of adding any unexpected electricity to the grid. To achieve this effect, you need special inverters that can operate in solar inverter island mode and big, reliable batteries.

What happens if solar islanding isn't prevented?

Here's what could happen if solar islanding wasn't prevented: The local grid goes down. Your grid-tied home solar power system still produces electricity. Once the panels have supplied electricity to your home, any excess energy flows back into the grid. Meanwhile, utility workers are repairing damaged power lines on the "should-be-dead" grid.

Does a solar inverter work if the grid goes down?

If the grid goes down for any reason, your solar panel system is designed to turn off automatically to ensure the safety of utility workers who might be fixing any damaged power lines. On the other hand, if you're completely off the grid, you're already on your own power island. Your islanding solar inverter works independently from the power grid.

Do solar panels have anti-Islanding inverters?

The short answer is no. UL Standard 1741 requires every grid-tied PV system to have a built-in anti-islanding solar inverter, and the solar industry follows that standard. While these laws were initially meant to protect utility workers, they've since been amended to include protection for your solar panel system and electricity grid at large.

For example, the Enphase IQ-8 can be paired with no more than a 295-watt panel because the peak output of the microinverter is 245 watts. So, if you pair the Enphase IQ8 with a 400-watt solar panel, you will still only get 245 watts. The peak output of the microinverter caps your solar panel production.
